

Manual testing

Day-10 Assignment

Test Metrics:

Test Metrics are measurements used in software testing to check the quality, progress, and performance of the testing process. They help testers know how much testing has been completed, how many defects are found, and whether the software is ready for release.

Objectives of Test Metrics

- Measure the testing progress.
- Check the quality of the software.
- Find defects early.
- Improve the testing process.
- Help in making project decisions.

Types of Test Metrics

1. **Process Metrics** – Measure the testing process.
2. **Product Metrics** – Measure the quality of the software.
3. **Project Metrics** – Measure the project's time, cost, and effort.

Common Test Metrics

- Test Case Execution Percentage
- Test Pass Percentage
- Test Fail Percentage
- Defect Density
- Defect Leakage
- Test Coverage
- Defect Removal Efficiency (DRE)

Agile Testing:

Agile Testing is a software testing approach where testing is done continuously throughout the software development process. Testers and developers work together to find and fix defects early, ensuring that the software meets customer requirements

Objectives of Agile Testing

- Ensure high-quality software.
- Find defects early.
- Deliver software quickly.
- Improve customer satisfaction.
- Support continuous testing and feedback.
- Reduce development and testing time.

Principles of Agile Testing

- Testing starts from the beginning of the project.
- Testing is done continuously in every sprint.
- Developers and testers work together.
- Customer feedback is important.
- Focus on delivering working software.
- Adapt quickly to requirement changes.

Agile Testing Life Cycle

1. **Requirement Analysis** – Understand customer requirements.
2. **Test Planning** – Prepare the testing strategy and test cases.
3. **Development** – Developers write the code.
4. **Testing** – Testers verify the software during each sprint.
5. **Bug Fixing** – Developers fix the reported defects.
6. **Retesting** – Testers verify the fixes.
7. **Release** – Deliver the tested software to the customer

Agile Testing Techniques

- Unit Testing
- Integration Testing
- System Testing
- Regression Testing
- Acceptance Testing
- Exploratory Testing
